Abstracts

The automatic cryostat microtome is a medical or laboratory equipment, specifically designed to rapidly and automatically cut frozen biological tissues or other materials into thin slices. It combines refrigeration technology with automatic slicing technology, enabling tissue slicing in a low-temperature environment. This equipment is primarily used in pathology laboratories and for rapid pathological diagnosis during surgery.

Working principle and advantages

The automatic cryostat microtome is mainly composed of three major parts: a refrigeration system, a slicing system, and a control system. Its working principle involves using physical cooling methods to freeze fresh tissue samples to a certain hardness, and then slicing them into thin sections using the blade of the microtome. Compared with conventional pathological slicing machines, the biggest feature of them is that they operate in a frozen environment. The conventional ones are typically used to process tissues that have undergone fixation treatments such as paraffin embedding, whereas automatic cryostat microtomes can quickly process tissues by directly slicing frozen, fresh tissues, significantly reducing diagnosis time.
