Abstracts

The automatic debris flow warning system is a comprehensive geological disaster prevention and control system that integrates sensor monitoring, data transmission, intelligent analysis, and automatic alarms. It is primarily used to monitor key parameters such as mountain rainfall, water levels, surface displacement, and mudflow velocity in real time. Upon detecting an abnormal change or exceeding a preset threshold, the system automatically issues a warning signal through audio, visual, text message, and broadcast, alerting personnel to take timely action. This system is widely used in areas prone to debris flows, such as mountain roads, reservoirs, mining areas, and villages and towns. It is a key technical means of achieving "early detection, early warning, and early avoidance" of geological disasters.

The global Automatic Debris Flow Warning System market size was estimated at USD 1206.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
