Abstracts

The diamond wire saw cutter differs from others, such as the bandsaw, by using abrasion instead of saw teeth. Thanks to the hardness of diamonds, the abrasion technique can be used to cut through almost any material that is softer than the diamond abrasive. The process also produces less kerf and wasted materials when compared with conventional solid blades. The wire cutter also allows circular cutting on all sides, preventing the wire from getting pinched and is therefore an effective method of resisting compressive forces while cutting a wide range of materials. The rope used on an industrial diamond wire saw machine is made from a loop of high tensile steel connected by a mechanical joiner. On the outside of the rope are carrier rings, on which diamonds are either sintered or retained by an electroplated layer. The final assembled diamond rope is then coated with an elastomeric compound, which helps to retain the components and to protect against corrosion.

The global Automatic Diamond Wire Saw Machine market size was estimated at USD 372.18 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
