Abstracts

Automatic friction welders are industrial machines that join materials through the application of frictional heat and axial pressure, eliminating the need for filler materials or external heat sources; these systems operate by rotating one workpiece against another under controlled force until the interface reaches a plastic state, after which rotation ceases and forging pressure is applied to create a high-integrity, solid-state bond. They are widely used in aerospace, automotive, oil and gas, and heavy machinery sectors for producing durable, defect-free welds in components such as shafts, valves, and turbine blades, with advantages including consistency, repeatability, and the ability to join dissimilar metals or high-strength alloys that are challenging for traditional welding methods.

The global Automatic Friction Welder market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
