## Abstracts

An Automatic Heat Distortion Tester is a specialized instrument used to measure the heat distortion temperature (HDT) of materials, particularly plastics and composites. It determines the temperature at which a material deforms under a specified load, providing crucial data on its thermal stability and performance. The tester automatically heats the specimen, applies a load, and records the temperature at which deformation occurs. This process ensures accurate and repeatable results, essential for quality control and material testing in various industries. The industry trend for Automatic Heat Distortion Testers is showing significant growth, driven by the increasing demand for high-performance materials in sectors such as automotive, aerospace, and construction.
