Report Overview

The automatic insulation tester is a kind of electrical testing instrument, which is used to measure the insulation resistance and insulation quality of insulating materials such as electrical equipment, motors, and cables. The insulation tester can detect whether the insulation material has leakage or insulation performance degradation, so as to ensure the safe operation of electrical equipment. Automatic insulation testers usually use DC voltage for testing. Common test voltages are 250V, 500V, 1000V, 5000V, etc. During the test, the tester will apply a test voltage to the insulating material to be tested, and measure the current on the insulating material to calculate the insulation resistance value. If the insulation resistance value is below a certain threshold, it indicates a problem with the insulating material. Automatic insulation testers usually have automation functions, can perform fast and accurate tests, and provide display and recording of test results. Some advanced testers can also perform data analysis and fault diagnosis, providing more detailed insulation condition assessment.
