## Abstracts

Laser soldering is a non-contact process that eliminates the risk of damaging sensitive components. Laser soldering is a laser soldering technology that uses laser as a heat source to heat the pad and melt the tin wire or solder paste to complete the soldering. The main feature of laser soldering is that it uses the high energy of the laser to quickly heat the local or tiny area to complete the soldering. Compared with traditional hot rod soldering and electric soldering iron soldering, the laser soldering machine has the characteristics of high processing accuracy, high efficiency, high yield rate and low production cost. Professional soldering software, simple operation, quick to get started; complete functional modules, flexible combination and matching, and high degree of automation. Laser technology is in line with the current industrial development trend of energy conservation, emission reduction and green environmental protection. As global environmental issues are increasingly concerned by people, keywords such as "energy conservation, emission reduction, pollution control, and green industry" frequently appear in the public's field of vision. Laser processing technology, as a new processing technology, has excellent characteristics such as no direct contact with tools, high processing efficiency, low energy consumption, no noise, and no environmental pollution. It not only meets the expectations of the public and the requirements of environmental protection related departments, but also reduces the cost expenditure of manufacturing enterprises on energy consumption and pollutant treatment in the production process. In general, the development of laser technology and the laser industry has positive significance for downstream manufacturing application industries, and the good substitution effect is in line with the current industrial development trend of green environmental protection. Laser soldering machines have extremely high precision and can achieve precise welding of tiny solder joints, which is crucial for electronic products, semiconductors, optoelectronic equipment and other fields. With the development of laser technology, the performance of laser soldering machines has

been continuously optimized to meet more high-demand applications. With the continuous advancement of laser technology (such as the popularization of fiber laser technology), the power, stability and efficiency of laser soldering machines have been greatly improved, thereby increasing market demand. The intelligence level of laser soldering machines continues to improve. Combined with technologies such as automatic alignment, machine vision, and automatic parameter adjustment, the accuracy and efficiency of welding are improved, human intervention is reduced, the automation level of the production line is improved, and the market development is further promoted. As the manufacturing industry, especially the products in the fields of electronics, automobiles, semiconductors, etc., continue to develop towards miniaturization, complexity, and high precision, the requirements for precision, stability, and reliability of welding technology are getting higher and higher. Laser soldering machines meet these growing demands with their high precision, low heat-affected zone (HAZ), and adaptability to complex solder joints. At present, the penetration rate of laser soldering is very low, and there is huge room for improvement. Laser soldering technology and equipment are gradually maturing, and different laser applications are developed according to different product requirements, such as laser solder ball soldering machines, laser tin wire soldering machines, laser solder paste soldering machines, etc. The traditional soldering market is gradually developing towards laser soldering.

The global Laser Soldering Equipment market size was estimated at USD 91.9 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
