## Abstracts

An automatic metallographic polisher is a precision instrument used in materials science and metallurgy for preparing metallographic samples for microscopic analysis. It automates the process of grinding, polishing, and etching samples to achieve a flat, smooth surface with high reflectivity. The polisher typically consists of a motorized polishing head that holds the sample against a rotating polishing disk or wheel, along with programmable controls for adjusting polishing parameters such as rotation speed, applied pressure, and polishing time. Automatic metallographic polishers are equipped with advanced features such as variable speed control, oscillating motion, and automatic abrasive dispensing systems to ensure consistent and reproducible results. They are commonly used in research laboratories, quality control facilities, and academic institutions to prepare metallographic samples for microstructural analysis, grain size measurement, phase identification, and defect detection using optical or electron microscopy techniques. These instruments offer advantages such as increased productivity, improved sample consistency, and reduced operator variability compared to manual polishing methods, making them indispensable tools in materials characterization and failure analysis.

The global Automatic Metallographic Polisher market size was estimated at USD 264.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
