## Abstracts

Automatic On Off Float Control Valves are valves that incorporate a float mechanism to automatically control the flow of liquid in a system. These valves are designed to open and close based on the liquid level within a tank or vessel. As the liquid level rises, the float rises with it, triggering the valve to close when a certain level is reached to prevent overflow. Conversely, as the liquid level drops, the float descends, causing the valve to open and allow more liquid to enter the tank or vessel.

The global Automatic On Off Float Control Valves market size was estimated at USD 496.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
