Report Overview:

Screen printing is a printing technique where a mesh is used to transfer ink onto a substrate, except in areas made impermeable to the ink by a blocking stencil. A blade or squeegee is moved across the screen to fill the open mesh apertures with ink, and a reverse stroke then causes the screen to touch the substrate momentarily along a line of contact. This causes the ink to wet the substrate and be pulled out of the mesh apertures as the screen springs back after the blade has passed. One color is printed at a time, so several screens can be used to produce a multicoloured image or design.

The Global Automatic Screen Printing Machines for Electronics Market Size was estimated at USD 184.71 million in 2023 and is projected to reach USD 256.14 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
