Report Overview:

The chemistry used in standard wafer cleaning has remained largely unchanged during the last 30 years. It is based on the use of the RCA clean process that utilizes acidic hydrogen peroxide and ammonium hydroxide solutions. While this is the primary method still used by industry, what has changed recently is its implementation along with new optimized cleaning technology that includes ozone cleaning and megasonic cleaning systems.

Manufacturing integrated circuits requires hundreds of precise processing steps depending on the specific device type. Most of the steps are completed as single processes on the complete wafer before they are diced into individual chips. About 20% of the steps are wafer cleaning processes, which highlights the importance of wafer cleaning and substrate surface conditioning.

The Global Automatic Silicon Wafer Cleaning Systems Market Size was estimated at USD 1303.73 million in 2023 and is projected to reach USD 1807.89 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
