Abstracts

Automatic telescopic overheight frame is an adjustable frame structure designed for transporting overheight containers, usually used to handle cargo that is taller than a standard container. Unlike fixed-height overheight frames, telescoping overheight frames are telescopic and can be adjusted according to the height of the container to accommodate overheight containers of different sizes. The frame can be expanded or contracted when needed through simple mechanical operations or hydraulic systems to ensure that the container is stable and safe during transportation. The advantage of the automatic telescopic overheight frame is its flexibility, which can easily handle containers of various heights, especially suitable for places such as ports, freight stations and logistics centers that need to frequently handle cargo of different heights. It effectively improves the efficiency of cargo loading and unloading, ensuring that there will be no problems during transportation due to overheight containers exceeding the transportation height limit.

The global Automatic Telescopic Overheight Frame market size was estimated at USD 53.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
