Report Overview

The automotive metal condenser is one of the key components in the automotive air conditioning system, used to condense refrigerant and change it from gaseous to liquid state. Its main function is to cool the hot gas in the air conditioning system into a liquid state through the process of heat and mass transfer, thereby reducing the temperature inside the car. Automotive metal condensers are usually made of metals such as aluminum or copper because these metals have good thermal conductivity and corrosion resistance, and can effectively transfer heat to the surrounding air. The condenser is usually located at the front of the car's engine compartment, adjacent to the radiator, and uses the air flow when the vehicle is running to reduce the temperature of the refrigerant.
