Abstracts

An automobile out wheel motor, also known as an in-wheel motor or hub motor, refers to an electric motor integrated directly into the wheel hub of a vehicle, enabling direct drive without the need for traditional mechanical components such as transmissions, drive shafts, or differentials. This design enhances powertrain efficiency by minimizing energy losses associated with mechanical transmission, while also offering benefits such as improved torque vectoring, enhanced vehicle stability control, and greater flexibility in vehicle design due to the elimination of centralized propulsion systems. These motors can be used in both fully electric and hybrid vehicles, and their adoption is increasingly relevant in the context of advancing electric vehicle (EV) technologies and the growing demand for energy-efficient, high-performance automotive solutions.

The global Automobile Out Wheel Motor market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 15.20% during the forecast period.
