Report Overview

It is a popular valve mechanism of automobile engine nowadays. In this structure, the camshaft is placed in the cylinder head and above the combustion chamber, which directly drives the rocker arm and valve without passing through a longer push rod. Compared with the push-rod engine with the same number of valves (i.e. the top valve structure), the components requiring reciprocating motion in the top camshaft structure are much less, which greatly simplifies the valve distribution structure, significantly reduces the weight of the engine, and also improves the transmission efficiency and reduces the working noise.

The global Automobile Overhead Camshaft market size was estimated at USD 1850.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
