Abstracts

An automobile preheating plug, commonly known as a glow plug in diesel engines, is an essential electrical heating device designed to aid cold starting by rapidly heating the combustion chamber to ensure proper ignition of diesel fuel in low-temperature conditions. It functions by converting electrical energy into heat through a resistive heating element, typically made of materials like silicon nitride or metal alloys, which expands when current is applied, enabling efficient fuel vaporization and combustion initiation. While traditional glow plugs serve a singular preheating purpose, modern variants, such as pressure sensor glow plugs, may also assist in post-start emissions control and engine management by providing real-time combustion pressure data to the engine control unit (ECU).

The global Automobile Preheating Plug market size was estimated at USD 120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
