Abstracts

The automobile wheel hub motor is an electric motor integrated directly into the wheel hub of a vehicle, eliminating the need for traditional drivetrain components such as axles, transmissions, and differentials. This technology enables direct drive to each wheel, allowing for independent control of torque and speed, which enhances vehicle dynamics, traction, and energy efficiency. Wheel hub motors are primarily used in electric vehicles (EVs) and hybrid electric vehicles (HEVs), offering advantages such as simplified vehicle architecture, increased interior space, and improved regenerative braking capabilities. The market for these motors is driven by the global shift toward electrification, advancements in motor efficiency and power density, and growing demand for in-wheel propulsion systems in passenger cars, commercial vehicles, and specialized applications like autonomous and off-road vehicles. Key challenges include managing unsprung mass, heat dissipation, durability under harsh conditions, and cost competitiveness compared to centralized electric drivetrains.

The global Automobile Wheel Hub Motor market size was estimated at USD 3420.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
