Abstracts

An automobile wheel motor, also known as an in-wheel motor or hub motor, is an advanced electric propulsion system integrated directly into the wheel hub of a vehicle, combining the motor, power electronics, and often braking components into a single compact unit that drives the wheel without requiring traditional drivetrain components like axles, transmissions, or differentials. By delivering torque directly to each wheel, it enables precise individual control, enhancing vehicle dynamics, traction, and efficiency while reducing mechanical complexity, weight, and energy losses associated with conventional powertrains. This technology is primarily utilized in electric vehicles (EVs) and hybrid systems, supporting features such as torque vectoring, regenerative braking, and improved space utilization due to the elimination of centralized motor and drivetrain elements.

The global Automobile Wheel Motor market size was estimated at USD 1280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
