Abstracts

An automotive active bonnet, also known as a pedestrian protection bonnet, is an advanced safety system designed to mitigate injuries to pedestrians in the event of a collision with a vehicle. This system utilizes sensors?typically accelerometers or pressure sensors?to detect an impact with a pedestrian, triggering actuators that instantly raise the rear section of the bonnet by several centimeters. By creating a deformable buffer zone between the bonnet and the rigid engine components underneath, the active bonnet helps absorb impact energy, reducing the risk of severe head and upper-body injuries. The system often integrates with other pedestrian safety technologies, such as automatic braking, and is engineered to deploy only in specific collision scenarios to avoid unnecessary activation.

The global Automotive Active Bonnet market size was estimated at USD 1180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
