Report Overview

The suspension system in a vehicle makes a vehicle ride comfortable and helps keep the vehicle in control. The suspension system essentially maximizes the friction between the tires and the road to provide steering stability and the required road grip. The main functionality of a suspension system is to offer driving comfort for passengers by absorbing vibrations and protection of the chassis components and body of the vehicle. The conventional suspension system is made up of several components like the chassis, which holds the body of the vehicle. The coil springs provide support to the vehicle weight and tend to absorb vibrations and noise when the vehicle is in contact with the road, thus reducing the shocks from affecting the passengers. The coil springs, struts, leaf springs and dampers are some of the suspension components which are predominantly used in all vehicles.
