Abstracts

Automobile refrigerant is a product used in automobile air conditioning and cooling. Regarding refrigerants, the EU's action was a precursor for what transpired the US. In 2015, the Environmental Protection Agency (EPA) announced a new rule under their Significant New Alternatives Policy, or SNAP, called Rule 20. This rule dictated the eventual phase out of HFC refrigerants, including R-134a, across the United States. The basis of the rule was that by the year 2020, or MY 2021, all new manufactured or imported vehicles would not be able to use R-134a. There is room for a few exclusions, but these can only push the date back to 2025. There are three refrigerants that can be used to replace R-134a: R-1234yf, R-152a and R-744. More on these replacements later. An interesting fact about the phase out of R-134a is that unlike the switch from R-12 to R-134a, there will be no mandatory reduction in production or imports of the refrigerant, which means that supplies of R-134a should be stable both in availability and cost. However, the demand will start shrinking with each passing year because no new vehicles after 2020 will be able to use it. Over the next 10 or so years, vehicles that use R-134a will inevitably end up in junk yards and the production of R-134a will be reduced, then disappear completely. Instead of a phase out, R-134a will be economically starved out of existence.
