Report Overview:

Automotive Condenser is the other heat exchanger in a mobile A/C system. Nowadays, condensers are usually made of aluminum, but in the past, some were made of copper/brass. Condensers look very much like radiators, just a little thinner, and since they also depend on air flowing through them, are usually located in front of the radiator.

All condensers carry the heat away from gas or steam. For some applications, the gas must pass a long tube (usually set into a solenoid), in order to allow heat loss to the surrounding air, such as thermal conductivity of copper metal commonly used in the transport steam. In order to enhance the efficiency of the condenser, pipe often attaches heatsink so as to speed up cooling. Heat sink is made of metal plate of good thermal conductivity. Generally a type of condenser fan is used to force air going through the heat sink and carrying the heat away.

The Global Automotive Condenser Market Size was estimated at USD 5530.29 million in 2023 and is projected to reach USD 5905.48 million by 2029, exhibiting a CAGR of 1.10% during the forecast period.
