Report Overview

An automotive condition monitoring system is an on-board defect detection system, which is built into vehicles and detects defective vehicle conditions and notifies the driver of potentially dangerous situations. It keeps track and reports on engine diagnostics, vehicle mechanical issues, water level, and fuel status, among other important data. A condition monitoring system comprises a control unit coupled to sensors and a data acquiring module that transmits data in the form of input to the control unit. The output information is projected onto the display module by the control unit. This, in turn, provides critical information to the driver, who can use it to avoid accidents or serious damage. In the wake of its multitude of benefits, especially safety assurance, the latest vehicles are preferably equipped with a condition monitoring system.
