Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automotive Dead Reckoning (ADR) Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Automotive Dead Reckoning (ADR) Module production reached approximately 624 k units, with an average global market price of around US\$ 462 per unit. An Automotive Dead Reckoning (ADR) module is a specialized device used in vehicles to maintain accurate positioning, especially when Global Navigation Satellite System (GNSS) signals, like GPS, are blocked or unreliable. It combines GNSS data with information from the vehicle's own sensors, such as wheel speed sensors (wheel ticks) and gyroscope data, to continuously estimate the vehicle's location and speed over time. This integration, often using a Kalman filter, provides uninterrupted and precise navigation, even in challenging environments like tunnels, parking garages, and underpasses. Inertial sensors and wheel speed sensors are key components, with representative manufacturers including Honeywell, Analog Devices, and Northrop Grumman. Downstream, ADR modules are ultimately used in in-vehicle navigation and smart cockpits, providing a continuous and seamless navigation experience for passenger vehicles and resolving user pain points such as "losing navigation signals in tunnels." This is currently the most widespread application scenario for ADR, which is gradually spreading from high-end vehicles to mainstream models. Autonomous driving systems are the area with the highest demands on ADR.

The global Automotive Dead Reckoning (ADR) Module market size was estimated at USD 287.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
