Abstracts

Automotive edge computing refers to the deployment of computing resources and data processing capabilities at or near the source of data generation within vehicles and transportation infrastructure, enabling real-time analysis and decision-making without reliance on centralized cloud systems. This paradigm leverages localized hardware, such as onboard vehicle computers, roadside units, and edge servers, to process data from sensors, cameras, lidar, and other IoT devices with minimal latency, supporting critical applications like autonomous driving, advanced driver assistance systems (ADAS), vehicle-to-everything (V2X) communication, and in-vehicle infotainment. By reducing dependence on cloud connectivity and bandwidth constraints, automotive edge computing enhances responsiveness, improves safety through instantaneous reactions, ensures data privacy by limiting external transmission, and optimizes network efficiency by filtering and aggregating data at the edge before selective cloud uploads.

The global Automotive Edge Computing market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
