Abstracts

An automotive engine radiator is a heat exchanger designed to regulate engine temperature by dissipating excess thermal energy generated during combustion. It consists of a core constructed of thin tubes, often made of aluminum or copper, which carry hot coolant from the engine, and fins that increase the surface area for efficient heat transfer to the surrounding air. Coolant flows through the radiator, where it releases heat before recirculating back to the engine, maintaining optimal operating temperatures and preventing overheating. Modern radiators may incorporate advanced materials, such as plastic tanks and aluminum cores, to balance durability, weight, and thermal performance, and are often integrated with auxiliary components like cooling fans and transmission oil coolers to enhance overall vehicle thermal management.

The global Automotive Engine Radiators market size was estimated at USD 2096.88 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
