Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automotive EPB Motor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Automotive EPB Motor is integrated in the electronic parking brake system EPB, converts electrical energy into mechanical energy, drives the brake caliper through the transmission mechanism to achieve parking brake, and realizes automatic locking and release of the parking lock. It has the characteristics of small size, high power density, large output torque, high speed, long life, low noise, and strong anti-electromagnetic interference ability. The Electrical Park Brake (EPB) refers to the technology that integrates temporary braking during driving and long-term braking after parking, and realizes parking braking by electronic control. The electronic handbrake is a technology that realizes parking braking by electronic control. Its working principle is the same as that of the mechanical handbrake, and both brake by tightening the rear wheel brake shoe by cable. There are two main types of automotive EPB motors. The caliper type is installed on the caliper, and a motor is installed on each of the two rear wheels. Its advantages are fast system response and the left and right wheels can be controlled separately. The disadvantage is high cost. The cable-type uses a motor to drive the two calipers of the motor through the cable, and its working mode is similar to that of the mechanical handbrake. Its advantage is that the cost is relatively low, and its disadvantage is that the response is relatively slow.

The global Automotive EPB Motor market size was estimated at USD 816.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
