Report Overview

Evaporative pressure regulator (EPR), which is a fully automatic suction pressure control device. The EPR installed in the compressor is a cylindrical structure with a diaphragm to prevent refrigerant leakage. When the evaporation pressure increases, this pressure acts on the diaphragm to overcome the pressure of the control spring, leaving the valve seat, resulting in an increase in the refrigerant flow from the evaporator to the compressor. When the evaporation pressure drops, the control spring will press the valve towards the valve seat, limiting the refrigerant flow from the evaporator, and at the same time, the evaporation pressure will increase until the valve is reopened.

The global Automotive Evaporator Pressure Regulator market size was estimated at USD 185.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
