## Abstracts

The automotive GPS antenna is a critical component within vehicle navigation systems, designed to receive signals from global positioning satellites and transmit them to the GPS receiver for accurate location tracking, route guidance, and real-time positioning. These antennas are engineered to operate effectively in the challenging automotive environment, accounting for factors such as signal interference from vehicle electronics, multipath distortion caused by reflections from surrounding structures, and the need for reliable performance across varying weather and terrain conditions. Typically integrated into the vehicle's roof, dashboard, or external mounts, automotive GPS antennas utilize specialized designs such as patch or helical configurations and often incorporate low-noise amplifiers (LNAs) to enhance signal strength and ensure consistent connectivity, even in urban canyons or dense foliage areas where satellite visibility may be limited.

The global Automotive Gps Antenna market size was estimated at USD 265.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
