Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automotive Grade Multi-junction VCSEL Chips competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Automotive grade multi-junction VCSEL chips are vertical-cavity surface-emitting lasers that integrate multiple emitting junctions vertically within a single chip. They offer high optical power, robustness, and high-temperature tolerance, tailored for automotive applications like LiDAR, in-cabin monitoring, and laser lighting, and must comply with AEC-Q102, IATF-16949 and other automotive standards. As intelligent vehicle technologies continue to evolve, automotive grade multi-junction VCSEL chips are becoming key optoelectronic components in advanced driver assistance systems (ADAS) and smart cockpit architectures. Compared to single-junction VCSELs, the multi-junction design delivers higher optical power without increasing chip footprint, thereby enhancing sensing accuracy and system responsiveness?crucial factors in autonomous driving applications. These chips also exhibit superior thermal management and packaging reliability, making them well-suited for automotive grade certification requirements such as the AEC-Q series. While international leaders have established strong technological foundations in this field, domestic Chinese players are rapidly catching up. Some local products have already entered OEM validation stages or limited-scale supply. As OEMs increasingly emphasize vertical integration and local sourcing, China's domestic supply chain is steadily maturing. Chinese companies are also making significant strides in core processes such as chip design, epitaxial growth, wafer-level packaging, and thermal interface materials?advancing toward self-reliant production. From a market perspective, the demand for automotive grade multi-junction VCSELs is concentrating in higher-tier applications such as L2+ and beyond autonomous driving systems, 3D lidar, driver

monitoring systems (DMS), and occupant monitoring systems (OMS). These use cases impose stringent requirements on beam stability, wavelength uniformity, and angular precision, prompting manufacturers to refine their structural and optical designs continuously. Going forward, companies with vertically integrated capabilities and strong co-development partnerships with OEMs are more likely to gain competitive advantages in this rapidly growing sector.

The global Automotive Grade Multi-junction VCSEL Chips market size was estimated at USD 249.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.50% during the forecast period.
