Report Overview

Imaging radar is an application of radar which is used to create two-dimensional images, typically of landscapes. Imaging radar provides its light to illuminate an area on the ground and take a picture at radio wavelengths. It uses an antenna and digital computer storage to record its images. In a radar image, one can see only the energy that was reflected back towards the radar antenna. The radar moves along a flight path and the area illuminated by the radar, or footprint, is moved along the surface in a swath, building the image as it does so.

The global Automotive Imaging Radar Sensors market size was estimated at USD 801.30 million in 2023 and is projected to reach USD 1082.63 million by 2032, exhibiting a CAGR of 3.40% during the forecast period.
