Abstracts

An induction heating system is a method of heating a conductive material using electromagnetic induction. It works by generating high-frequency alternating current (AC) in a coil, which creates a fluctuating magnetic field. When a conductive material is placed within the magnetic field, it induces electric currents (known as eddy currents) within the material. These eddy currents create resistance within the material, causing it to heat up due to the Joule effect. Induction heating can be used in most body panels, chassis, drivetrain, electrical or Metal heat treatment of engine components.

The global Automotive Induction Heating System market size was estimated at USD 1850.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
