Abstracts

With highly automated drive levels, not only are exterior assistance systems being enhanced, the interior of vehicles is also being reshaped to provide a holistic in-vehicle experience using in-cabin sensing technology. The Interior Monitoring System (IMS), which is comprised on Driver Monitoring System (DMS) and Occupant Monitoring Systems (OMS), use cameras and radars to capture important first-order biometric features of drivers and occupants, such as gaze, head position and pupil diameter, among many other key facial features. It detects minute fluctuations in pupil diameter and calculates brain activity level, especially high cognitive load. On-board monitoring system has gradually become the standard configuration of automobiles. In addition to monitoring and recording the situation inside and outside the vehicle, the on-board monitoring system also has functions such as driver monitoring and fatigue driving reminders to ensure driving safety. With the development of smart cockpit and automatic driving technology, the functions of vehicle monitoring system will be further enhanced. For example, the monitoring system can monitor the status of the driver in real time to ensure driving safety; at the same time, the monitoring system can also monitor the running status of the vehicle to provide data support for vehicle maintenance. The vehicle monitoring system will be closely integrated with the Internet and cloud technology to realize remote monitoring and management of data. This allows car owners and passengers to check the status and data of the vehicle anytime, anywhere, improving the car experience.

The global Automotive Interior Monitoring System market size was estimated at USD 1062.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
