Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automotive MCU Functional Chips competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Automotive MCU function chips are embedded chips that integrate a CPU, memory, I/O interfaces, and peripherals. As the core of the automotive electronic control unit (ECU), they are responsible for real-time processing of sensor data, executing control algorithms, and driving actuators. These chips cover scenarios such as engine management, body control, smart cockpits, and autonomous driving. Their core features include low power consumption, high reliability, and wide operating temperature, and they must meet automotive-grade certification standards. The upstream segment focuses on core materials and equipment: semiconductor materials such as silicon wafers and photoresists support chip manufacturing, while equipment such as lithography machines and etching machines enable high-precision processes. The midstream encompasses chip design and manufacturing, with design companies developing customized solutions based on the ARM Cortex-M series cores, and foundries balancing performance and cost using 28nm/40nm processes. The downstream segment encompasses automotive applications and system integration, with automakers and Tier 1 suppliers embedding MCUs into powertrain, chassis, and cockpit systems, optimizing functionality through over-the-air (OTA) upgrades. Global sales of automotive MCU functional chips are expected to reach 9.8 billion units in 2024, with an average selling price of approximately US\$0.6 per unit.

The global Automotive MCU Functional Chips market size was estimated at USD 5880.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
