Report Overview

Metal forming is the metalworking process of fashioning metal parts and objects through mechanical deformation; the workpiece is reshaped without adding or removing material, and its mass remains unchanged. Forming operates on the materials science principle of plastic deformation, where the physical shape of a material is permanently deformed.

Aluminum is expected to show the fastest growth over the forecast period, by material type. It is rapidly replacing steel in many automotive applications like body in white and chassis. The usage rate (%) of aluminum for forming applications is higher in Europe and North America when compared with that in Asia Oceania. The consumer spending power and vehicle costs are higher in countries such as the US and Germany, as compared to the developing economies. Thus, automakers are increasing the use of expensive lightweight materials such as aluminum, which helps to reduce the overall vehicle weight, thus improving the performance and fuel efficiency. However, it is 35-40% costlier than steel, because of which it has a low penetration in Asia Oceania.

The Global Automotive Metal Forming Market Size was estimated at USD 233556.63 million in 2021 and is projected to reach USD 273855.61 million by 2028, exhibiting a CAGR of 2.30% during the forecast period.
