Report Overview

The global automotive motor rotor market was valued at USD 3.40 billion in 2024 and is expected to reach USD 6.34 billion in 2033, maintaining a compound annual growth rate (CAGR) of 7.19% during the forecast period from 2025 to 2033.

The global motor rotor market is driven by several key factors, including energy transition and electrification, industrial automation and intelligent manufacturing, energy-saving and emission reduction policies, and technological innovation. The motor rotor is the rotating component of a motor, typically positioned opposite the stator?the stationary part of the motor. The rotor is a core rotating element usually equipped with armature windings and an iron core. In DC motors, the armature windings generate induced electromotive force (EMF) when energized, whereas in AC motors, the rotor generates EMF through rotation under the influence of the stator's magnetic field. Taking automotive drive motors as an example, they include components such as the stator, rotor, windings, bearings, and fans. The motor core, which includes the stator and rotor cores, is one of the critical parts for energy conversion. The quality and performance of these cores directly determine key indicators such as performance, energy efficiency, and stability of the drive motor. According to LookWhole Insight statistics, the stator and rotor?being core components?account for nearly 30% of the total value of motor parts.
