Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automotive OLED touch Controller IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of Automotive OLED touch Controller ICs will reach 46.992 million units, with an average selling price of US\$2.5 per unit. An OLED touch chip is an integrated circuit (IC) based on capacitive sensing principles. It's specifically designed to detect and process finger or stylus contact on OLED displays, converting physical contact into electronic signals to enable interactive control of the device. It comprises an embedded touchscreen controller IC and a touch display integrated driver IC (TDDI). TDDI integrates the touchscreen controller into a DDIC. Its display principle is the same as that of TFT-LCD display driver ICs and is currently primarily used in LCD-screen smartphones. Existing dual-chip solutions use a separate system architecture, separating the display driver IC from the touchscreen IC, potentially introducing display noise. TDDI, on the other hand, utilizes a unified system architecture, enabling more efficient communication between the touchscreen and display driver ICs, effectively reducing display noise and better meeting the design requirements of thinner, narrower-bezel mobile electronic devices. In the field of automotive displays, TDDI can integrate touch sensors into automotive displays to obtain thinner, clearer and lower-cost screens; as the number of car screens increases and their sizes increase, TDDI is expected to usher in new demand.

The global Automotive OLED touch Controller IC market size was estimated at USD 117.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
