Abstracts

Automotive parking brakes are critical safety systems designed to secure a stationary vehicle and prevent unintended movement, typically functioning through mechanical, electro-mechanical, or fully electronic actuation mechanisms. Mechanical systems, such as traditional hand-operated levers or foot pedals connected via cables to drum or disc brake assemblies, remain prevalent in many vehicles, especially in cost-sensitive segments. However, electro-mechanical parking brakes (EPB) are increasingly adopted in modern vehicles, utilizing electric motors integrated into the rear brake calipers for automated application and release, often enhancing convenience features like auto-hold and hill-start assist. Fully electronic systems, integrated with vehicle stability control and autonomous driving functions, represent the next evolution, offering dynamic control and contributing to advanced driver-assistance systems (ADAS). The market is characterized by a shift toward electronic solutions driven by demands for improved safety, space efficiency in cabin design, and compatibility with automated driving technologies.

The global Automotive Parking Brake market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
