Abstracts

Die casting is a metal forming method in which metal melted at a high temperature is poured into a mold (die). In die casting, a precision metal mold (die) is filled with molten metal at high speed under high pressure, instantly forming a product (casting). The raw materials used include non-ferrous alloys such as aluminum, magnesium and zinc. Die casting is characterized by high dimensional accuracy and allows for the mass production of thin-walled products with complex shapes. Die casting also has the advantage of producing smooth casting surfaces requiring less machining after molding. These advantages make die casting suited for use in making various components for automobiles, motorcycles, home appliances, office equipment, industrial machinery and builders' hardware. Aluminum die castings are lightweight and have excellent durability and recyclability. This report mainly includes automotive parts aluminum die casting. Aluminum die castings are lightweight and have excellent durability and recyclability. As electric vehicle production increases in line with decarbonization targets, aluminum die-casting products can help improve fuel efficiency and electricity consumption.
