### Report Overview:

Automotive Radiator is heat exchangers used for cooling internal combustion engines in automobile.

Internal combustion engines are often cooled by circulating a liquid called engine coolant through the engine block, where it is heated, then through a radiator where it loses heat to the atmosphere, and then returned to the engine. Engine coolant is usually water-based, but may also be oil. It is common to employ a water pump to force the engine coolant to circulate, and also for an axial fan to force air through the radiator.

In automobiles with a liquid-cooled internal combustion engine, a radiator is connected to channels running through the engine and cylinder head, through which a liquid (coolant) is pumped.

The Global Automotive Radiator Market Size was estimated at USD 1253.50 million in 2023 and is projected to reach USD 1395.12 million by 2029, exhibiting a CAGR of 1.80% during the forecast period.
