Report Overview

A rain sensor or rain switch is a switching device activated by rainfall. There are two main applications for rain sensors. The first is a water conservation device connected to an automatic irrigation system that causes the system to shut down in the event of rainfall. The second is a device used to protect the interior of an automobile from rain and to support the automatic mode of windscreen wipers. An additional application in professional satellite communications antennas is to trigger a rain blower on the aperture of the antenna feed, to remove water droplets from the mylar cover that keeps pressurized and dry air inside the wave-guides.

The global Automotive Rain Sensor market size was estimated at USD 4429.70 million in 2023 and is projected to reach USD 7050.66 million by 2032, exhibiting a CAGR of 5.30% during the forecast period.
