Abstracts

A slipper clutch, also known as a back-torque limiter, is a specialized motorcycle clutch designed to mitigate the effects of engine braking during aggressive downshifting or rapid deceleration, particularly in high-performance and sport riding scenarios. Unlike a standard clutch, which transmits torque bidirectionally, a slipper clutch incorporates a ramp-and-roller or spring-cam mechanism that allows the clutch plates to partially disengage when rear wheel torque exceeds engine torque, preventing rear wheel hop, loss of traction, and instability. This technology is primarily found in sport bikes, supermotors, and racing motorcycles, where it enhances control, safety, and drivetrain longevity by reducing stress on the transmission and chassis during hard braking and corner entry.

The global Automotive Slipper Clutch market size was estimated at USD 540.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
