Abstracts

Automotive solid-state lidar refers to a type of light detection and ranging technology that uses no moving mechanical parts, instead relying on solid-state components such as optical phased arrays or micro-electromechanical systems (MEMS) to steer laser beams and generate high-resolution, three-dimensional maps of the surrounding environment. Unlike traditional mechanical lidar systems, which employ rotating assemblies to achieve 360-degree coverage, solid-state lidar is characterized by its compact form factor, higher durability, lower production costs at scale, and improved reliability due to reduced susceptibility to vibration and wear. It operates by emitting laser pulses and measuring the time it takes for the light to return after reflecting off objects, enabling precise distance and spatial awareness critical for advanced driver assistance systems (ADAS) and autonomous vehicle navigation. Key performance metrics include range, resolution, field of view, and frame rate, with ongoing advancements focused on enhancing these parameters while meeting automotive-grade standards for safety, temperature tolerance, and longevity.

The global Automotive Solid State Lidar market size was estimated at USD 220.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 32.15% during the forecast period.
