Report Overview

A spring brake chamber is a brake chamber that includes both service brake and spring brake sections. The spring brake section houses a powerful spring that acts as a parking brake or an emergency brake when air pressure is not applied to that section of the brake chamber. The two sections of a spring brake act independently of each other and have their own air supplies and diaphragms. Spring brake chambers apply the brakes by means of a large coil spring that provides enough force to hold the brakes in the applied position, instead of using air to apply the brakes.

The global Automotive Spring Brake Chamber market size was estimated at USD 2800.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
