Abstracts

An automotive stereo camera is a sophisticated vision system that integrates two precisely spaced cameras to capture synchronized images from slightly different perspectives, mimicking human binocular vision to enable depth perception and three-dimensional environmental mapping through stereoscopic triangulation. This technology calculates object distance, size, and relative motion by analyzing the disparity between corresponding points in the left and right images, providing critical data for advanced driver assistance systems (ADAS) and autonomous driving functions such as adaptive cruise control, lane keeping, collision avoidance, and pedestrian detection. Unlike monocular systems, stereo cameras deliver accurate depth information without relying on prior object recognition or motion parallax, though they require precise calibration, robust computational power for real-time processing, and resilience to environmental variables like lighting conditions and occlusions.

The global Automotive Stereo Camera market size was estimated at USD 3240.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
