Abstracts

The automotive tailgate spring is an elastic device installed at the hinge of the trunk. It provides support through physical elastic force or air pressure/hydraulic principle to ensure that the tailgate maintains a stable angle and hovers at any position after opening. Its core functions include support and hovering, which offsets the tailgate's own weight through preset elastic force or gas pressure to prevent the tailgate from closing or sagging accidentally; opening and closing assistance, which reduces the force required to manually open or close the tailgate, and some high-end models can even achieve automatic lifting; safety protection, using a slow-down design to prevent the tailgate from closing quickly to avoid collision or pinching the user.

The global Automotive Tailgate Spring market size was estimated at USD 358.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
