Abstracts

A thyristor, also known as a silicon-controlled rectifier (SCR), is a solid-state semiconductor device that functions as a controlled switch for high-power electrical applications, primarily used to regulate power by controlling the phase angle of alternating current (AC) waveforms. In the automotive industry, SCRs are critical components in various systems requiring efficient and robust power management, such as electronic ignition systems, voltage regulators, motor control units (e.g., for power windows, seats, or cooling fans), and increasingly in electric and hybrid vehicle powertrains for managing battery charging, inverter operation, and auxiliary power distribution. These devices are valued for their ability to handle high current and voltage levels, reliability under harsh environmental conditions (including temperature extremes and vibrations typical in automotive settings), and their role in improving energy efficiency and enabling precise control of electrical loads, which supports advancements in vehicle electrification, safety systems, and overall electronic integration.

The global Automotive Thyristor (Scr) market size was estimated at USD 318.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
