Report Overview

Turbocharger is a type of forced induction system. Turbocharger uses the exhaust flow from the engine to spin a turbine, which in turn spins an air pump, compressing the air flowing into the engine. Turbocharger lets the engine squeeze more air into a cylinder and more air means more fuel can be added. So the engine can produce more power without increasing the engine emissions. The turbocharger has four main components, the turbine, the compressor, the control system and the bearing system.

The global Automotive Twin Turbochargers market size was estimated at USD 3820.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
