Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Autonomous Delivery Robots competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The autonomous delivery robots are made up of sensors and navigation technology which allows them to travel on roads, sidewalks and indoor scene without a driver or on-site delivery staff. Autonomous delivery robot can be used in different settings such as food delivery, package delivery, hospital delivery, and room service. There is still room for significant improvement in the perception, execution, interaction, and decision-making functions of automatic delivery robots. In addition, the current automatic delivery robots generally run at a slow speed. For safety reasons, automatic delivery robots are only allowed to conduct road tests in specific closed scenes or relatively open roads, and cannot achieve normal delivery in all scenarios. Therefore, the maturity of autonomous driving technology will be a key element for automatic delivery robots to achieve full-scenario normal delivery. With the continuous investment of enterprises, autonomous driving technology will become more and more mature. With the rise of labor costs, it has become an industry trend for distribution robots to replace labor. As labor-intensive industries, express delivery and food delivery are directly affected by rising labor costs. With the continuous increase of labor costs, the gap between labor costs and distribution robot costs is gradually narrowing. In order to cope with the gradually rising distribution labor costs, it has become a trend for distribution robots to replace labor.

The global Autonomous Delivery Robots market size was estimated at USD 124.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.70% during the forecast period.
