Report Overview

An autonomous mobile robot (AMR) is a robot that performs behaviors or tasks with a high degree of autonomy. The AMR relies on autonomous navigation where no wires, tape, GPS or other navigation markers are required. Its laser guidance system assures precise navigation, obstacle avoidance and human safety. The drive-around mapping with laptop adjustments enables fast and easy route updates and additions. The demands placed on the functionality of autonomous robotic systems are significantly higher compared to conventional industrial robots. The aim is that mobile systems operate autonomously in unknown and dynamic environments to fulfill their assigned tasks. For this purpose, it is essential to explore and model the environment in a suitable way. The information gathered by sensors has to be combined to allow for an accurate positioning. In addition, the perceived surroundings have to be consolidated in an exact map representation. Having acquired this knowledge, the robot is able to plan an optimal collision-free path to a given goal and to perform complex handling tasks.

The global Autonomous Mobile Robots (AMR) market size was estimated at USD 1997 million in 2023 and is projected to reach USD 15871.20 million by 2032, exhibiting a CAGR of 25.90% during the forecast period.

North America Autonomous Mobile Robots (AMR) market size was estimated at USD 777.05 million in 2023, at a CAGR of 22.20% during the forecast period of 2024 through 2032.
